1 Introduction

These test instructions are to be used in examining the suitability of protective agents for the protection of outdoor concrete structures owned by Finnish Transport Agency. These instructions concern hydrophobic impregnation agents, pore filling impregnation agents, coatings, sacrificial antigraffiti agents and cleanable antigraffiti agents. The test programme is prepared corresponding to typical Finnish bridge environments using as much European test standards as possible. On the basis of test results Finnish Transport Agency decides on the acceptability of protective agents for their use. The approved materials are published in SILKO-directions which are available on the web pages of Finnish Transport Agency.

The test specimens for SILKO-tests are treated with protective agent by the product agent under the surveillance of the VTT representative. Any exception to this procedure should be noted in the test report.

2 Product groups and their test programmes

Part of the SILKO-tests are obligatory and part of them are voluntary. The obligatory tests must be carried out on all the materials that are applied for acceptance by Finnish Transport Agency. The voluntary tests are carried out to prove that a material has a special property suitable for a special case. The properties of different groups of materials that are tested are given in chapter 3, along with the test methods.

Other than the European test methods of the test programme are described in chapter 4.

3 SILKO test programme and criteria of protective agents of concrete

3.1 Hydrophobic impregnation agents

Property	Test method	Criterion and grading			
		+	++	+++	++++
Obligatory tests					
Product identification	IR/ XRD	No criterion			
Water permeability	EN 13580	Absorption rate, % of reference			
		< 15	≤ 10	≤ 5	
Water vapour permeability	EN ISO 7783-2 (film on a substrate)	s_D , m			
		> 50	≤ 50	< 5	
Chloride permeability	SILKO-test (Chapter 4.1)	Chloride content, % of reference			
		≤ 100	≤ 20	≤ 15	≤ 8
Frost-salt durability using carbonated specimens	CEN/TS 12390-9	Scaling			
		≤ 100	≤ 65	≤ 25	≤ 10
Penetration depth	EN 1504-2	Penetration depth, mm			
		≥ 2	≥ 5	≥ 10	≥ 15
Voluntary tests					
Frost-salt durability using non-carbonated specimens	CEN/TS 12390-9	Scaling, % of reference			
		≤ 100	≤ 65	≤ 25	≤ 10
Carbonation prevention	NT BUILD 357	Carbonation depth, % of reference			
		≤ 100	≤ 60	≤ 20	
Cleanability	SILKO-test (Chapter 4.3)	Grading: 5 Cleans completely ... 0 Does not clean			
Removability	SILKO-test (Chapter 4.5)	No criterion/ grading			
Effect on potential measurement	SILKO-test (Chapter 4.6)	No criterion/ grading			

3.2 Pore filling impregnants

Property	Test method	Criterion and grading			
		+	++	+++	++++
Obligatory tests					
Product identification	IR/ XRD	No criterion			
Water permeability	EN 1062-3	No grading, only criterion: w , $\text{kg/m}^2 \cdot \text{h}^{1/2}$			
		$< 0,1$	-	-	
Water vapour permeability	EN ISO 7783-1 (free film) 1) EN ISO 7783-2 (film on a substrate) 1)	s_D , m			
		> 50	≤ 50	< 5	
Chloride permeability	SILKO-test (Chapter 4.1)	Chloride content, % of reference			
		≤ 100	≤ 20	≤ 15	≤ 8
Adhesion	EN 1542	Adhesion strength, MPa *) $\geq 1,5$ (1,0) *) The value in brackets is the lowest accepted value of any reading.			
Frost-salt durability using-carbonated specimens	CEN/TS 12390-9	Scaling, % of reference			
		≤ 100	≤ 65	≤ 25	≤ 10
Penetration depth	EN 1504-2	Penetration depth, mm			
		≥ 2	≥ 5	≥ 10	≥ 15
Voluntary tests					
Frost-salt durability using-non-carbonated specimens	CEN/TS 12390-9	Scaling, % of reference			
		≤ 100	≤ 65	≤ 25	≤ 10
Carbonation prevention	NT BUILD 357	Carbonation depth, % of reference			
		≤ 20	≤ 15	≤ 8	
Cleanability	SILKO-test (Chapter 4.3)	Grading: 5 Cleans completely ... 0 Does not clean			
Removability	SILKO-test (Chapter 4.5)	No criterion/ grading			
Effect on potential measurement	SILKO-test (Chapter 4.6)	No criterion/ grading

3.3 Coatings

Property	Test method	Criterion and grading		
		+	++	+++
Obligatory tests				
Product identification	IR/ XRD	No criterion		
Water permeability	EN 1062-3	No grading, only criterion: $w, \text{kg/m}^2 \cdot \text{h}^{1/2}$		
Water vapour permeability	EN ISO 7783-1 (free film) 1)	s_D, m		
	EN ISO 7783-2 (film on a substrate)1)	> 50	≤ 50	< 5
Chloride permeability	SILKO-test (Chapter 4.1)	Chloride content, % of reference		
Carbonation prevention 2)	NT BUILD 357	Carbonation depth, % of reference		
		≤ 20	≤ 15	≤ 8
Carbon dioxide permeability 2)	SFS-EN 1062-6	No grading, only criterion: s_D, m		
Adhesion	SFS-EN 1542	Adhesion strength, MPa		
		Crack bridging coatings: $\geq 0,8$ Others: $\geq 1,5$		
Cleanability	SILKO-test (Chapter 4.3)	Grading: 5 Cleans completely ... 0 Does not clean		
Freeze thaw durability	CEN/TS 12390-9	After the test: Only slightly defected. Adhesion: Crack bridging coatings: $\geq 0,8 \text{ MPa}$, In the case of cohesion failure $\geq 0,4 \text{ MPa}$ Others: $\geq 1,5 \text{ MPa}$.		
Dry film thickness	SILKO-test (Chapter 4.7)	Polymer coatings: $\geq 300 \mu\text{m}$ Cement based coatings: $\geq 2000 \mu\text{m}$		
Voluntary tests				
Crack bridging ability	EN 1062-7 -30 °C	Crack width at failure, mm		
Removability	SILKO-test (Chapter 4.5)	$\geq 0,3$	$\geq 0,6$	$\geq 1,0$
		Easily removable		
Effect on potential measurement	SILKO-test (Chapter 4.6)	No criterion		
Declared by manufacturer				
UV-resistance	EN 11507, 500 h	No sensory changes after the test		
Water resistance	SILKO-test (Chapter 4.8)	No sensory irreversible changes after the test		
Alkali resistance	SILKO-test (Chapter 4.9)	No sensory irreversible changes after the test

2) Systems that form a continuous film

3) Alternative tests

4 SILKO-TEST METHODS

4.1 Chloride permeability

4.1.1 Concrete specimens to be treated with the protective agent and their curing

The test specimens consist of concrete cubes measuring 100 x 100 x 100 mm³, with 3 cubes per each protective agent and 3 additional reference cubes per each series of test.

The concrete from which the cubes are made is the same as used for the water permeability test, SFS-EN 13580.

For 28 days after casting, the cubes are stored at a temperature (t) of $20 \pm 2^\circ\text{C}$ and a relative humidity (RH) of $95 \pm 5\%$. For the following 14 days up to the age of 42 days, the cubes are stored at $t = 20 \pm 2^\circ\text{C}$ and $\text{RH} = 65 \pm 5\%$.

4.1.2 Application of the protective agent and its curing

The cubes are sandblasted and the protective agent is applied to all sides of the concrete cubes in accordance with the manufacturer's instructions.

The test specimens are cured in accordance with the manufacturer's instruction. After this the specimens are kept at $t = 20 \pm 2^\circ\text{C}$ and $R = 65 \pm 5\%$ for 7 days.

Test procedure

The following curing times and conditions are required for the tests:

- 56 days in a 15% NaCl solution,

The concrete cubes are weighed in the beginning of the test and when they are removed in the NaCl-solution. The accuracy of the weighing machine must be 0.1 g.

Water-soluble chloride contents are determined from powder samples using the Mohr method (EN 1744-1:1998 Chapter 9) at depths of 0 to 20 mm and 20 to 50 mm. The samples are detached from vertical sides, with the casting face on the top. One sample is taken from both depths of each cube. Chloride content is determined from the powder obtained by combining the samples from the three cubes.

4.1.3 Test results

Test results are presented as percentage of chloride by weight of the concrete at depth ranges of 0 to 20 mm and 20 to 50 mm. Also the ratios of the chloride contents compared to the chloride contents of the reference cubes are presented.

4.2 Effect of the protective agent on carbonation rate

4.2.1 Concrete specimens to be treated with the protective agent and their curing

The test is carried out using concrete prisms measuring 40 x 40 x 160 mm³, with two prisms per each protective agent as well as 2 reference prisms per each series of tests.

Composition of the concrete is identical to that used in the water permeability test, SFS-EN 13580. After casting, the prisms are cured at $t = 20 \pm 2^\circ\text{C}$ and $\text{RH} = 95 \pm 5\%$ for a period of 28 days. Following this, the prisms are sandblasted and they are dried for 24 hours in a vacuum oven with a temperature of $30 \pm 2^\circ\text{C}$. Vacuum suction must be in operation for 8 hours from the start of the drying process.

The prisms are kept in plastic bags until they are treated with the protective agent at the age of about 42 days.

4.2.2 Application of the protective agent and its curing

The protective agent is applied to all sides of the prisms and cured in accordance with the manufacturer's instructions.

4.2.3 Test procedure

The test is carried out according to NT BUILD 357.

The test consists of storing the treated prisms and non-treated reference prisms in air with a carbon dioxide content of 3..5 % for a period of 3 months. The storage temperature is $20 \pm 2^\circ\text{C}$ and relative humidity $65 \pm 5\%$.

Carbonation is monitored during the test by cutting one treated prism and one reference prism at one third of its length following a carbon dioxide treatment of 0, 0.5, 1, 2 and 3 months, respectively, and by applying a phenolphthalein indicator to the exposed surface. The carbonation depth of the exposed surfaces is measured. The exposed surfaces can also be photographed.

Accelerated carbonation of the prisms through the exposed surfaces is prevented by applying a suitable resin to these surfaces.

4.2.4 Test results

The ratio of the carbonation depth of the treated prisms to that of the non-treated reference prisms following a carbon dioxide treatment of 0, 0.5, 1, 2 and 3 months are presented as the test results. If so desired, the pictures may be accompanied by photographs showing the carbonated areas.

4.3 Cleanability

4.3.1 Concrete specimens to be treated with the protective agent

The test is carried out using ready-made sandblasted concrete paving slabs measuring 40 x 300 x 300 mm³, with 2 slabs per each protective agent and 2 non-treated reference slabs per each series of tests. The slabs are stored at least for 14 days before using at $20 \pm 2^{\circ}\text{C}$ and relative humidity $65 \pm 5\%$.

4.3.2 Application of the protective agent and its curing

The protective agent is applied to the sandblasted surface of the concrete slabs and cured in accordance with the manufacturer's instructions.

4.3.3 Test procedure

The sandblasted surface of the treated slabs and non-treated reference slabs is divided into three sections. Graffiti is drawn on one section using paint from a spray can, on one section using alkyd paint and on one section using a water-proof felt pen.

After the application of the graffiti, the slabs are stored for 7 days at a relative humidity of $65 \pm 5\%$ and a temperature of $20 \pm 2^{\circ}\text{C}$, after which they are photographed and one slab per each protective agent and one reference slab is cleaned using (high-pressure) water cleaning (using hot water) and one using a cleaning agent and method recommended by the manufacturer of the protective agent.

After cleaning, a visual inspection of the slabs is carried out to evaluate how effectively the applied paint has been removed. The slabs are also photographed.

4.3.4 Test results

Test results are presented in the form of a numeric evaluation of how effectively the applied paint was removed, accompanied by photographs taken after cleaning. The numeric value varies from 0 to 5.0 means that the graffiti does not remove at all and a value of 5 means that the graffiti removes totally.

4.4 Frost-salt test using carbonated specimens

Composition of the concrete used for the test specimens is identical to that used in the water permeability test, SFS-EN 13580.

The test is carried out according to prENV 12390-9 using carbonated test specimens. The specimens are cut from the concrete cubes and before treatment with the protective agent placed in a chamber with the carbon dioxide content of 3...5 % and RH of $65 \pm 5\%$ for 28 d.

4.5 Removability of a protective agent

4.5.1 Concrete specimen to be treated with the protective agent and its curing

A sandblasted prefabricated concrete paving slab, 40 x 300 x 300 mm³, is used as test specimen.

4.5.2 Application of the protective agent and its curing

The protective agent is applied on the sandblasted surface of the slab according to the instructions of the manufacturer.

4.5.3 Test procedure

The slabs are cured at 20 ± 2 °C at 65 ± 5 % relative humidity for at least 7 days.

The protective agent is removed according to the instructions given by the manufacturer.

If the manufacture does not recommend any removal method, the protective agent is removed by sandblasting from an area of 100 x 100 mm². The sandblasting is carried out using glass balls, 6 bar pressure, \varnothing 8 mm nozzle, from 40 mm distance, perpendicular to the surface. Sandblasting is carried out along 10 mm wide stripes. The nozzle is moved back and forth at the rate of 200 mm/s.

The removability of the protective agent is estimated paying attention to the difficulty of removing and remnants of the protective agent.

4.5.4 Test results

The estimation of removability as well as the amount of protective agent remnants are given as test results.

4.6 Effect of a protective agent on potential measurement

4.6.1 Concrete specimens to be treated with the protective agent and their curing

Concrete beams, 100 x 100 x 500 mm³, in the centre of which there is a reinforcement bar protruding from both ends, are used as test specimens. The ends of the reinforcement bar are greased to prevent corrosion. One prism is used per each protective agent. Composition of the concrete is identical to that used in the water permeability test, SFS-EN 13580. The specimens are cured at $t = 20 \pm 2$ °C and $RH = 95 \pm 5$ %. At the age of 7 days the specimens are removed to $RH = 40 \pm 5$ %. At the age of 28 days the upper surface of the specimens is sandblasted.

4.6.2 Application of the protective agent and its curing

At the age of 42 d the sandblasted surface of the slab is treated according to the instructions of the manufacturer.

4.6.3 Test procedure

At the age of 91 d the potential measurement of the reinforcing bar is carried out. The potential is first measured from the non-treated side and then from the treated side.

4.6.4 Test results

The potential readings of both sides of the specimen and their relation are given as test results.

4.7 Dry thickness of the protective agent

4.7.1 Specimens

The thickness of the protective agent on the test specimens used for any test(s) is measured.

4.7.2 Test procedure

A test specimen is broken. The thickness of the protective agent is measured on the fracture surface using a microscope with a magnification of at least 50 x. The length of the surface to be measured is at least 100 mm.

4.7.3 Test results

The minimum, maximum and average thicknesses of the protective agent are given as test results.

4.8 Water resistance

4.8.1 Test specimens

Test specimens are concrete prisms, 160 x 40 x 40 mm³, the number of which is 2 per each protective agent.

Composition of the concrete is identical to that used in the water permeability test, SFS-EN 13580.

After casting, the prisms are first cured for a period of 28 days at $t = 20 \pm 2^\circ\text{C}$ and $\text{RH} = 95 \pm 5\%$ and then for at least 14 days at $t = 20 \pm 2^\circ\text{C}$ and $\text{RH} = 65 \pm 5\%$.

4.8.2 Application of the protective agent and its curing

Three long sides of the prisms cast against the form are pre-treated and treated according the manufacturer's instructions.

The treated specimens are cured according to the manufacturer's instructions. In addition to the before mentioned special curing the specimens are stored at $t = 20 \pm 2^\circ\text{C}$ and $\text{RH} = 65 \pm 5\%$ for a period of 7 days.

4.8.3 Test procedure

The prisms are placed in water at room temperature in such a way that the long side is downwards. The volume of the solution is at least four times that of the total volume of the specimens. The solution is changed in two week intervals. The duration of the test is 6 weeks after which the specimens are removed at $t = 20 \pm 2$ °C and $RH = 65 \pm 5$ % for 7 days.

The condition of the protective agent is evaluated visually before and after the test.

4.8.4 Test result

Changes of the protective agents are reported as test results.

4.9 Alkali resistance

4.9.1 Concrete specimens to be treated with the protective agent and their curing

Test specimens are concrete prisms, $160 \times 40 \times 40$ mm³, the number of which is 2 per each protective agent.

Composition of the concrete is identical to that used in the water permeability test, SFS-EN 13580.

After casting, the prisms are first cured for a period of 28 days at $t = 20 \pm 2$ °C and $RH = 95 \pm 5$ % and then for at least 14 days at $t = 20 \pm 2$ °C and $RH = 65 \pm 5$ %.

4.9.2 Application of the protective agent and its curing

Three long sides of the prisms cast against the form are pre-treated and treated according the manufacturer's instructions.

The treated specimens are cured according to the manufacturer's instructions. In addition to the before mentioned special curing, the specimens are stored at $t = 20 \pm 2$ °C and $RH = 65 \pm 5$ % for a period of 7 days.

4.9.3 Test procedure

The prisms are placed in saturated Ca(OH)₂-solution at room temperature in such a way that the long side is downwards. The volume of the solution is at least four times that of the total volume of the specimens. The solution is changed in two week intervals. The duration of the test is 6 weeks after which the specimens are removed at $t = 20 \pm 2$ °C and $RH = 65 \pm 5$ % for 7 days.

The condition of the protective agent is evaluated visually before and after the test.

4.9.4 Test result

Changes of the protective agents are reported as test results.
